The second oligonucleotide is specific for a nuclear oncogene of proto-oncogene selected from myc, jun, c-ets, c-fos, c-myb, B-myb, c-rel, c-vav, c-ski, c-spi, cyclin Dl, PML/RAR alpha, AMLL/MTGB, E2A/prl and ALL-1/AF-4. The composition Is used for treating cancer. The combination of antisense oligonucleotides has synergistically enhanced ability to inhibit growth of cancer cells.

malignanacy. The cellular immunogen comprises allogenic cells transfected with transgene construct comprising a transgene communog to target proto-oncogene and a strong promoter. The cellular immunog is useful for vaccinating a host against cancer by inserting the transgene construct into the body of the host for the expression of the transgene. The method of the invention is designed to target mutation-driven non-self determinants. The cellular immunogens induce reactivity for self-determinants in the over expressed product of tu

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention provides a novel method of altering the activity of the CC protein kinase A (PKA) signaling pathway in a cell that comprises CC altering the extent of phosphorylation of one or more PKA substrates, or CC kinase substrates downstream in the PKA signaling pathway. Pharmaceutical CC compositions containing a nucleic acid molecule that encodes a PKA CC substrate, or fragment, precursor or functionally equivalent variant, CC where the sequence is modified to alter its susceptibility to CC phosphorylation by PKA can be used for treating a disorder exhibiting CC— abnormal PKA signaling activity, immunosuppressive disorders or proliferative diseases. They can be used for treating e.g. HIV infection, AIDS, common variable immunodeficiency or cancers. Conditions CC in which upregulation of the PKA pathway is required, such as autoimmune CC disease, e.g. systemic lupus erythematosus, may also be treated. The CC wherein the substrate is in the Src-family, preferably Lck, Fyn, Src, Yes, Fgr, Lyn, Hck Blk, Yrk, C-tkl, Fyk, Src-l or Src-2.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or

                                                                                                                                                                                                                                                                                           The present invention describes a method for detecting a genetic mutation in the yeal gene for the diagnosis of a yeal mediated neuropsychiatric disorder in a human. The method comprises detecting the presence or absence of a genetic mutation in the yeal gene of the subject, where the genetic mutation is a substitution, insertion or a deletion and results in the production of a yeal protein having an amino acid sequence other than the wild-type yeal amino acid sequence and the presence of the genetic mutation identifies a subject that has or is at risk for developing a yeal mediated neuropsychiatric disorder. Compounds that bind to the yeal protein, alter the amount of the protein, or alter the activity of the yeal gene product, are useful for treating a yeal mediated neuropsychiatric disorder. The disorders include Huntington's disease, parkinson's disease, and especially bipolar-affected disorder (BAD) also known as bipolar mood disorder (BP) or manic-depressive illness. The method distinguishes neuropsychiatric disorders from neurological disorders, which enables more accurate evaluation and prescription of medical treatment. The present sequence represents the

The present invention describes primer sets for synthesising 5602 CC full-length cDNAs defined in the specification. Where a primer set CC comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of CC cligonucleotide comprises at least 15 nucleotides; or (b) a combination CC complementary strand of a polynucleotide which comprises a 5'-end CC complementary strand of a polynucleotide which comprises a 5'-end CC complementary to comprises a 1 least 15 nucleotides; or (b) a combination CC complementary to comprises a 1 least 15 nucleotides and the combination of CC cligonucleotide comprises a 3'-end sequence, where the CC cligonucleotide comprises a 1 selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in GC cligonucleotide comprises are useful for synthesising polynucleotides, and cc in gene therapy. The primers are useful for synthesising polynucleotides, CC particularly full-length cDNAs. The primers are also useful for the GC cligonucleotides of the abnormality of the proteins encoded by CC chapsing to the total and sequence and cc in the comprise of the abnormality of the proteins encoded by CC cligonucleotides. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs seasily without any specialised methods. AAH03166 to AAH13628 and CC AAH13633 to AAH18742 represent human cold sequences; AAB92446 to CC AAB9583 represent invano acid sequences; AAA9246 to AAH13632 cof the present invanion acid sequences; and AAH13629 to AAH13632 cof the present invanion acid sequences; and AAH13629 to AAH13632 cof the present invanion acid sequences; and AAH13639 to AAH13632 cof the present invanion acid sequences; and AAH13639 to AAH13632 cof the present invanion acid sequences; and AAH13639 to AAH13632 cof the present invanion acid sequences; and AAH13639 to AAH13632 cof the present invanion acid sequences; and AAH13639 to AAH13632 cof the present in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              29-JUL-1999;

They migrate at faster rates than non-transformed counterparts; have an enhanced ability to inhibit the formation of thrombi and/or dissolve thrombi once they have formed and exhibit reduced mononuclear cell adhesion. They can also be used to improve the success of surgical procedures such as coronary angioplasty, heart bypass surgery, vessel graft and stent

This sequence encoding the Src protein, can be used to modulate anglogenesis. When the Src protein is inactivated, anglogenesis is inhibited, while when it is activated, anglogenesis is potentiated. The modified or variant Src can be used to treat inflammatory diseases like, arthitis, rheumatoid arthitis, diabetic retinopathy, restenosis, osteoporosis and cancer associated disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        inflammatory disease; diabetic retinopathy;

Transformed cells produce increased amounts of pp60 c-src and have improved therapeutic properties. They migrate at faster rates than non-transformed counterparts; have an enhanced ability to inhibit the formation of thrombi and/or dissolve thrombi once they have formed and exhibit reduced mononuclear cell adhesion. They can also be used to improve the success of surgical procedures such as coronary angioplasty, heart bypass surgery, vessel graft and stent implantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

The present sequence represents a human src family kinase (SFK)

designated laloo. Laloo plays a key role in the transformation of early

stage embryonic cells to mesodermal cells and is likely to be a

C proto-oncogene. SFK nucleic acids may be used to produce SFK proteins

and the functional domains of SFK, according to standard recombinant DNA

methodologies. The laloo SFK protein is involved in the transformation

of early stage embryonic cells into mesodermal cells and consequently

mutations its nucleic acids are major causes of early developmental

disorders. SFK is also thought to be a proto-oncogene involved in tumour

formation. Therefore, the nucleic acids may be used to study the

physiological and biochemical processes that cause early developmental

defects and tumour growth. The nucleic acids may be used as probe to

identify similar nucleic acids in biological samples and to quantify

clevels of expression. They may also be used to detect alterations within

those nucleic acids which may be related to disease. They may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sec_name:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .Jocumentation_block:
